

Familiarize yourself with phishing attacks

we conducted a phishing test over the entire department of the organization, and we found high vulnerabilities among this teams:

HR	75% phishing Access rate
Marketing	38% phishing Access rate
Card service	10% phishing Access rate

What is phishing?

- Pretending to be someone in order to gain access to the system security or
- Tricking a people into providing sensitive information such as a password, credit card information, or personal data

Learn to spot phishing emails

<think of an effective way to show examples of the tactics used in phishing emails>

- Check the sender email and ask your self a question: Have I ever received an email from email address? If my email is compromised who should notify me?
- Observe if the email contain urgency or an immediate action. Usually phishing email contain urgency
- Observe if any spelling error occur
- Check the URL. Look for any misspellings or unusual domains

How do we stop getting phished?

- Be Skeptical: Always question unexpected emails, especially those asking for personal information
- Check the URLs: Hover over links to see the actual URL before clicking. Look for misspellings or unusual domains
- Verify sources: contact the organization directly using official contact methods to confirm any requests for information.
- Educate yourself: stay informed about common phishing tactics and new scams
